Abstract

We propose and demonstrate a novel, compact and simple-to-construct optical fiber thermometer based on Surface Plasmon Resonance (SPR) phenomenon, its temperature sensitivity is -3066 pm/°C and it was tested from 10°C to 40°C.

1.- Introduction

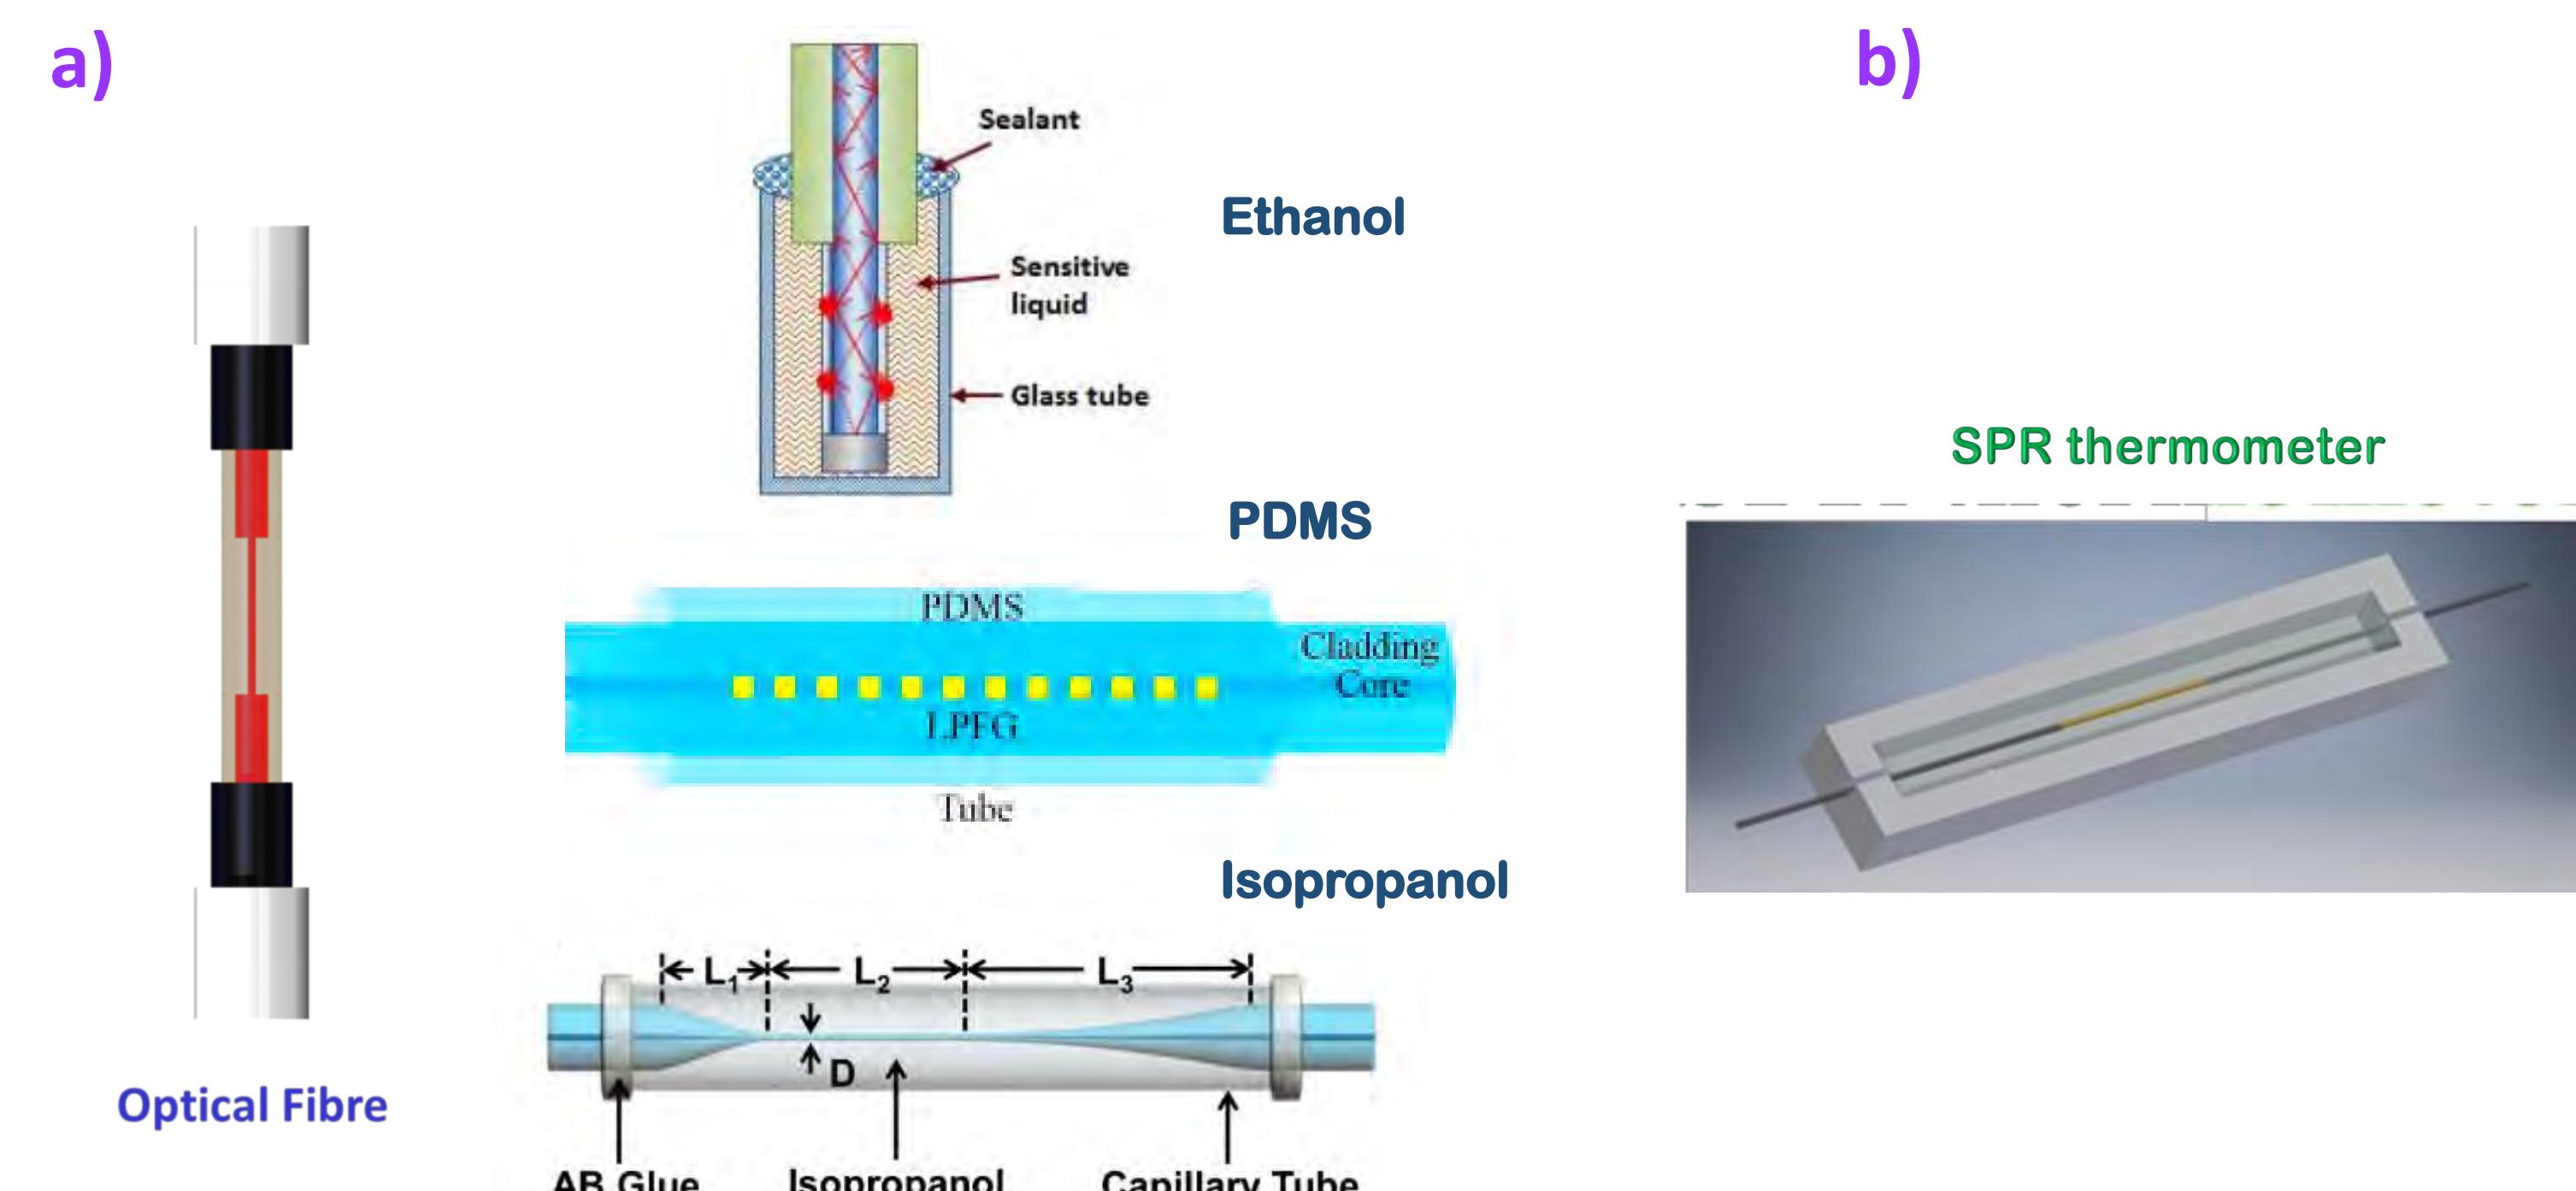

Fig. 1. Temperature Sensors: a) A single refractive index sensor can become a thermometer sensor adding a thermoresponsive materials [1-3], and b) sketch of the final structure of the proposed sensor head.

a)

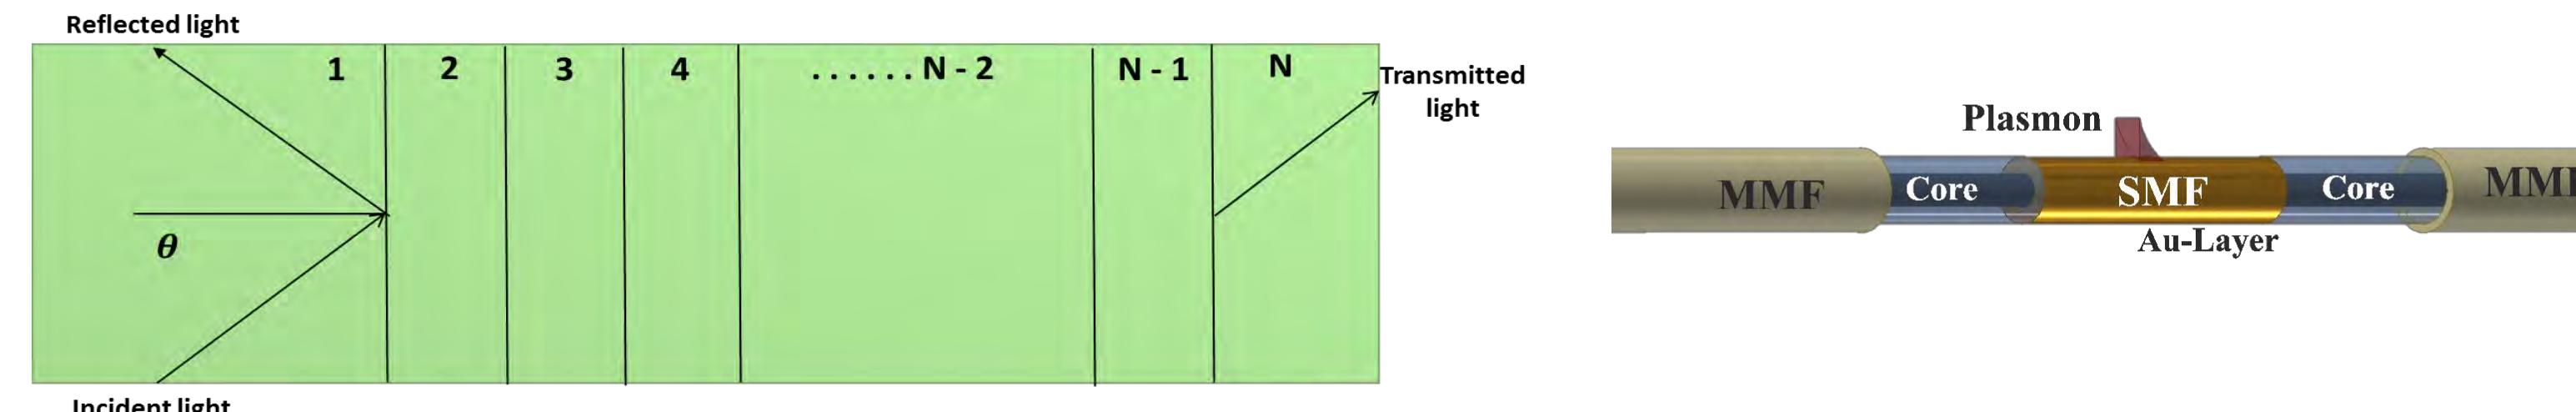

Fig. 2. a) Multilayer model for the calculation of reflection coefficient (R_p) [3], b) a representation of the hetero-core structure coated with gold layer and SPR phenomena.

Transmitted power

$$P = \frac{\int_{\theta_c}^{\pi} R_p^{N_{ref}(\theta)} \left(\frac{n_1^2 \sin \theta \cos \theta}{(1 - n_1^2 \cos^2 \theta)^2} \right) d\theta}{\int_{\theta_c}^{\pi} \left(\frac{n_1^2 \sin \theta \cos \theta}{(1 - n_1^2 \cos^2 \theta)^2} \right) d\theta}$$

3.- Fabrication Process and Experimental Setup

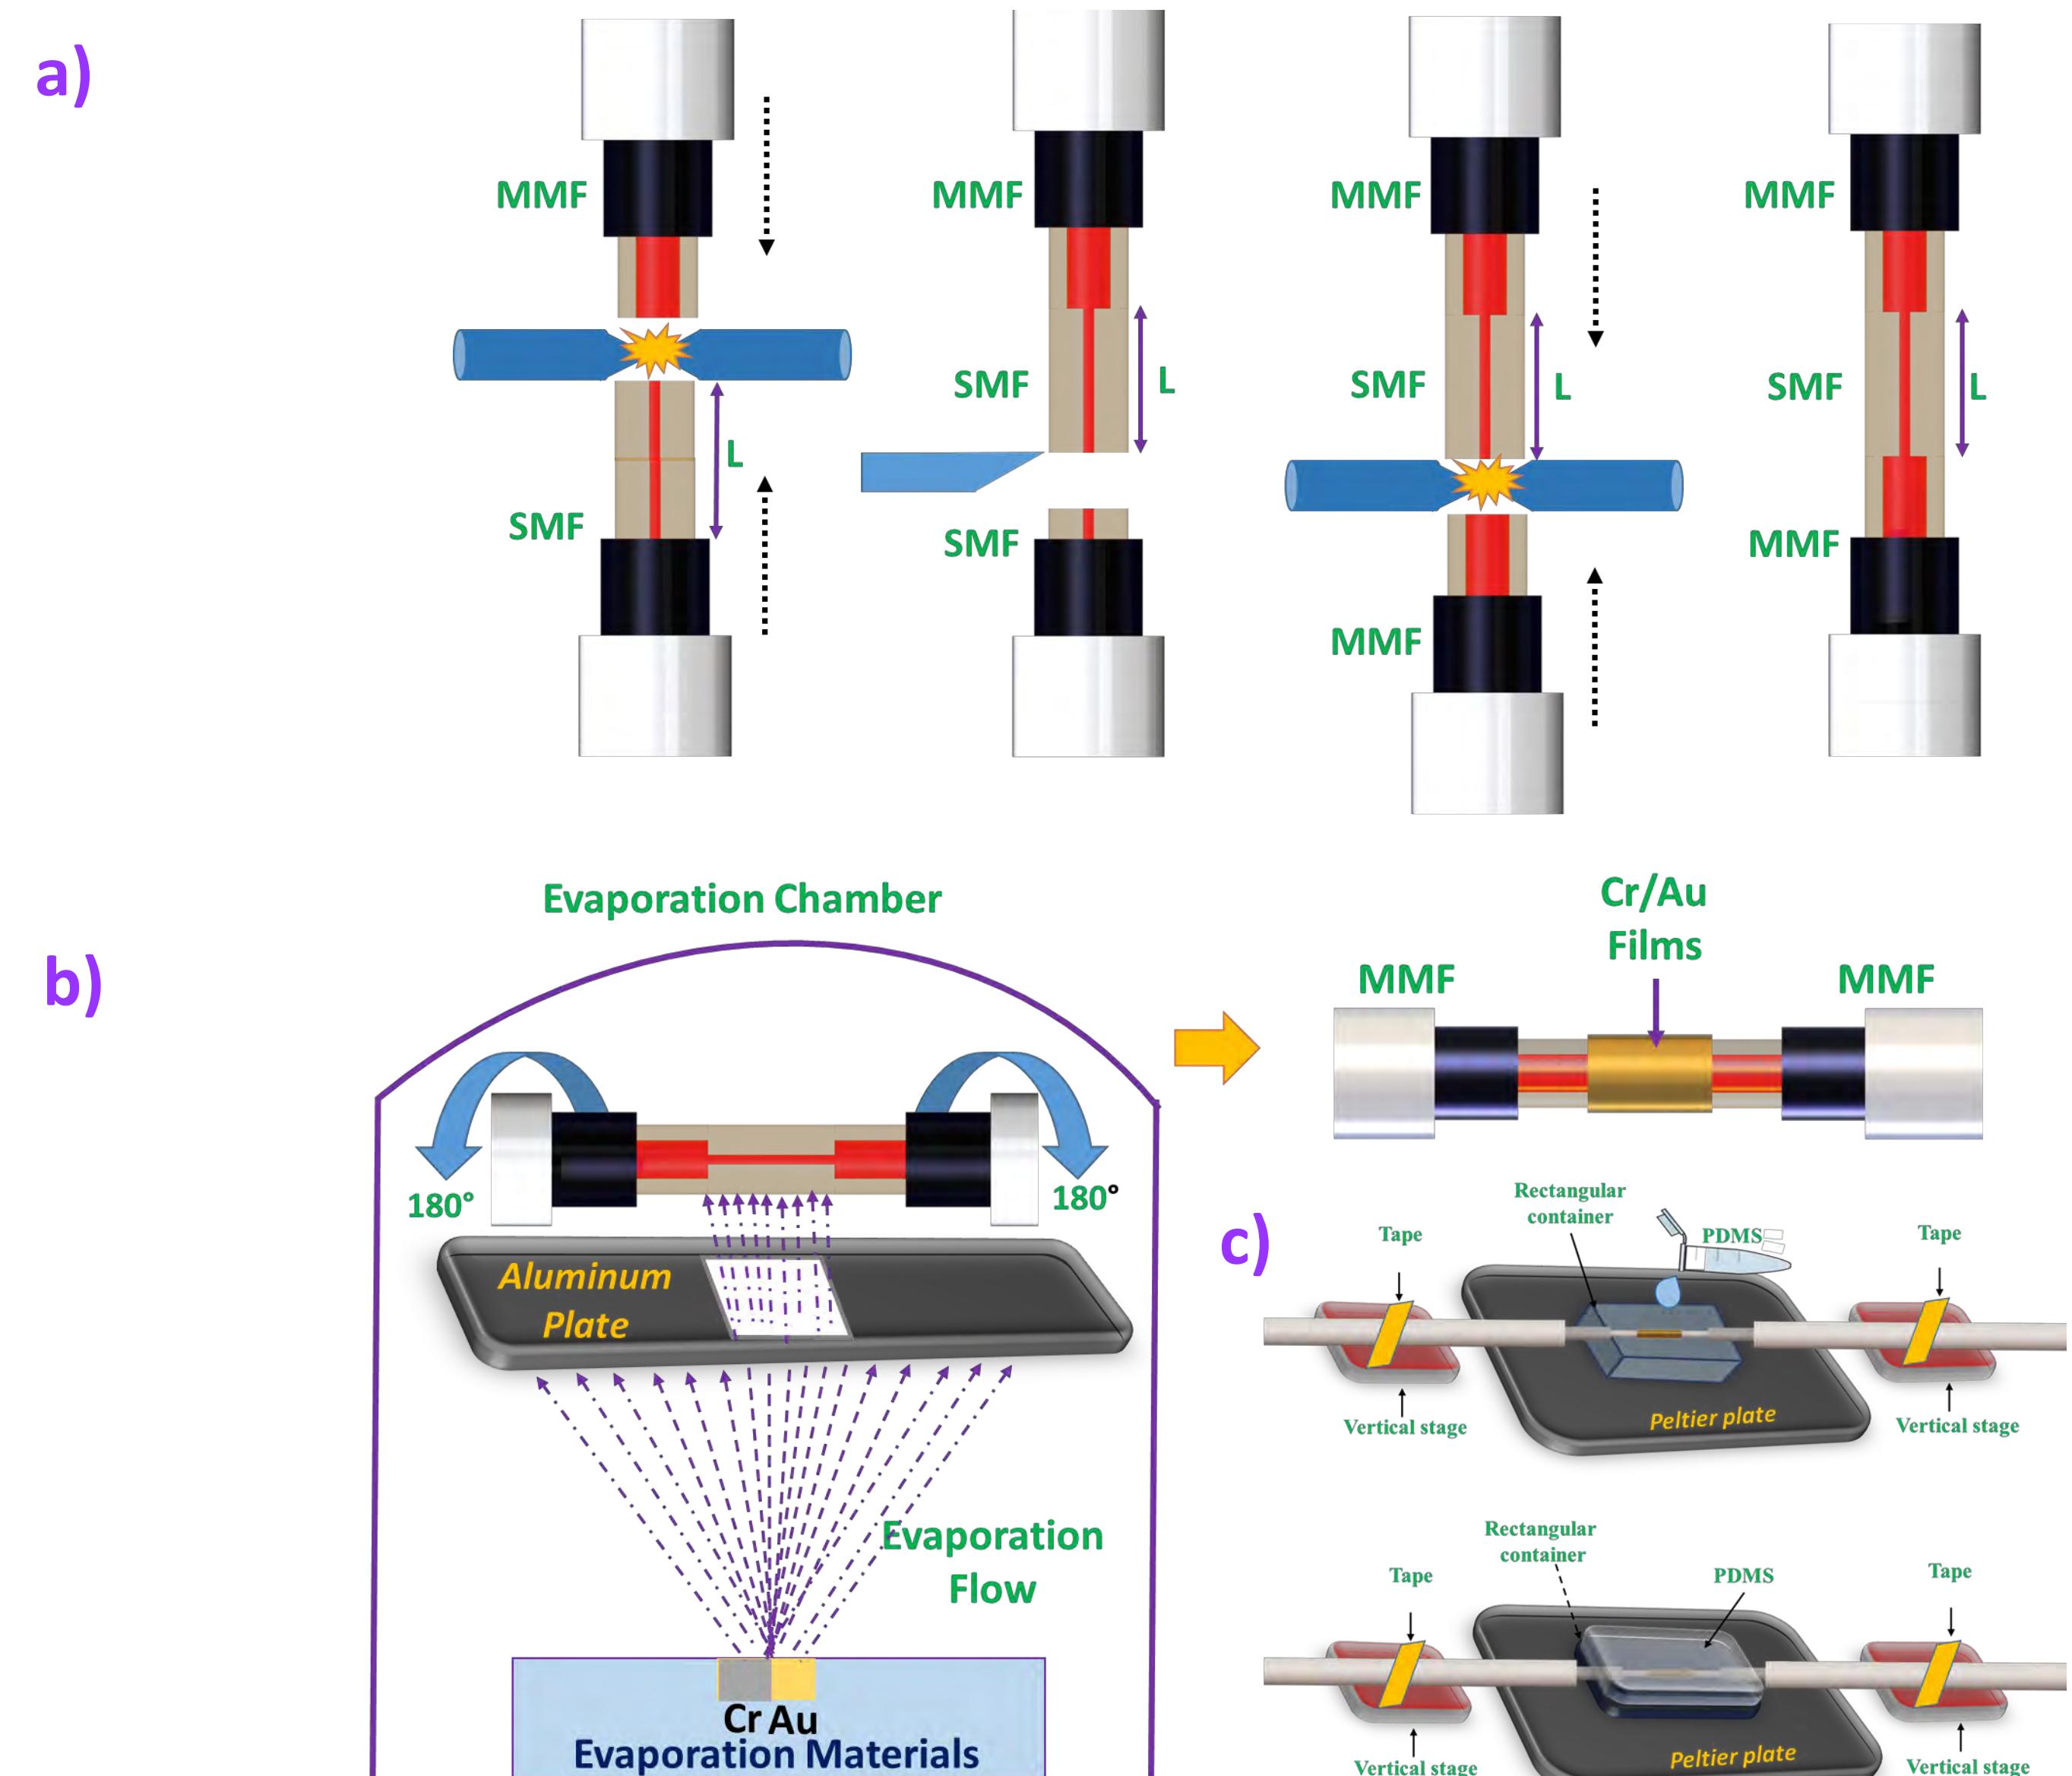

Fig. 5. Fabrication process: a) MMF-SMF-MMF structure, b) Metal layer deposition, and c) temperature sensor head.

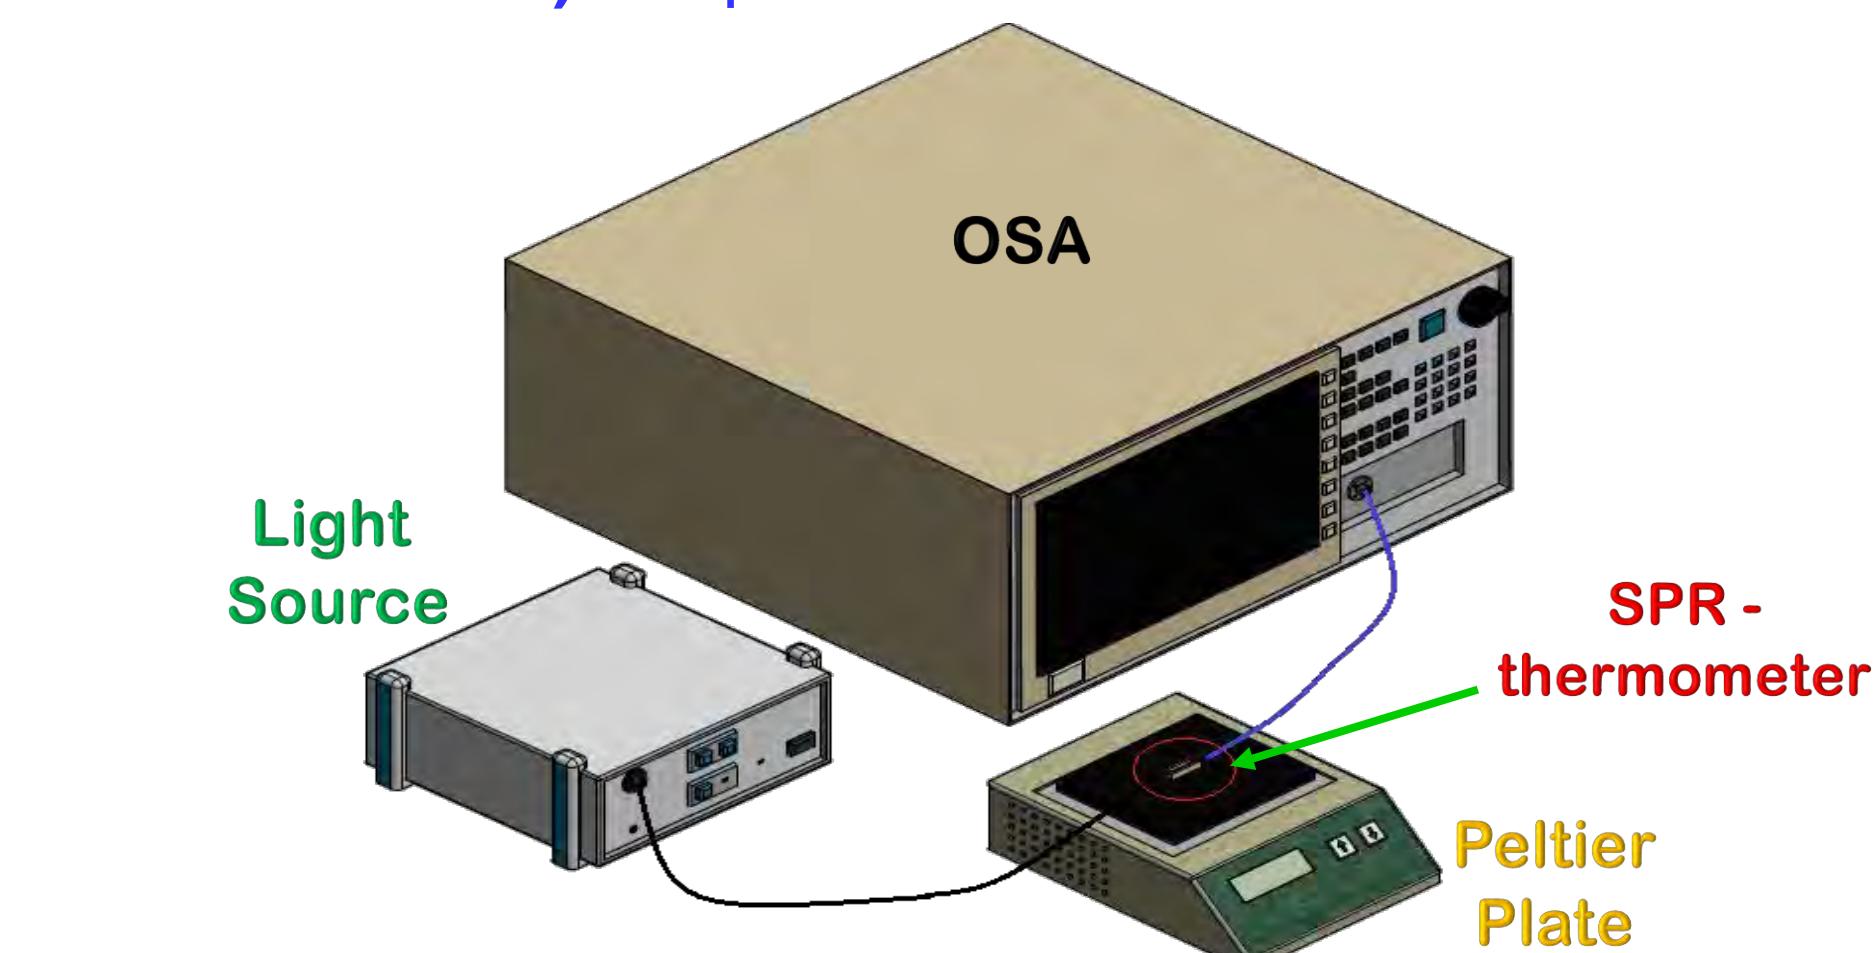

Fig. 6. Experimental Setup.

4.- Experimental Results

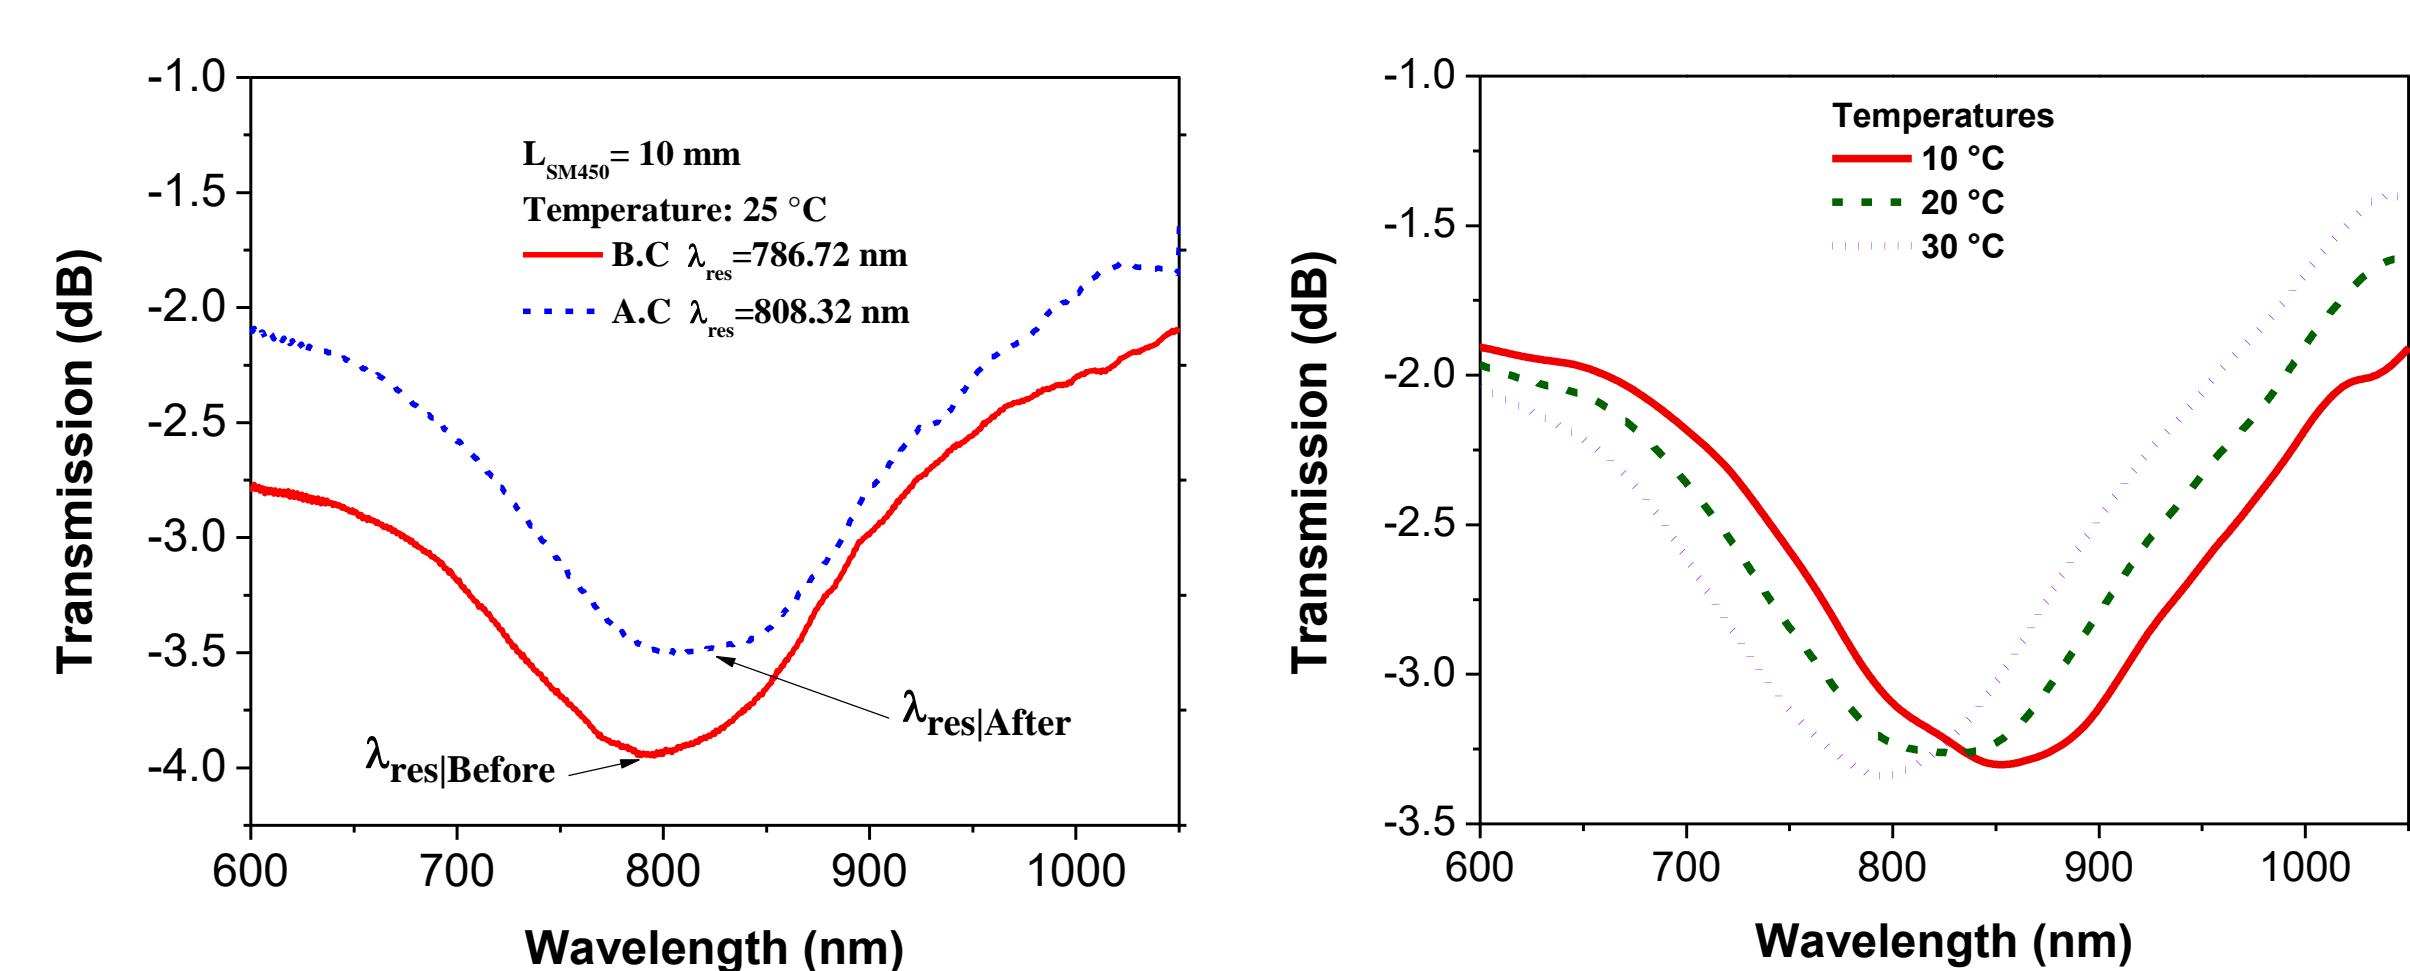

Fig. 7. Experimental reflected spectra of fiber SPR sensor: a) Before and after curing the PDMS, b) Different Temperatures.

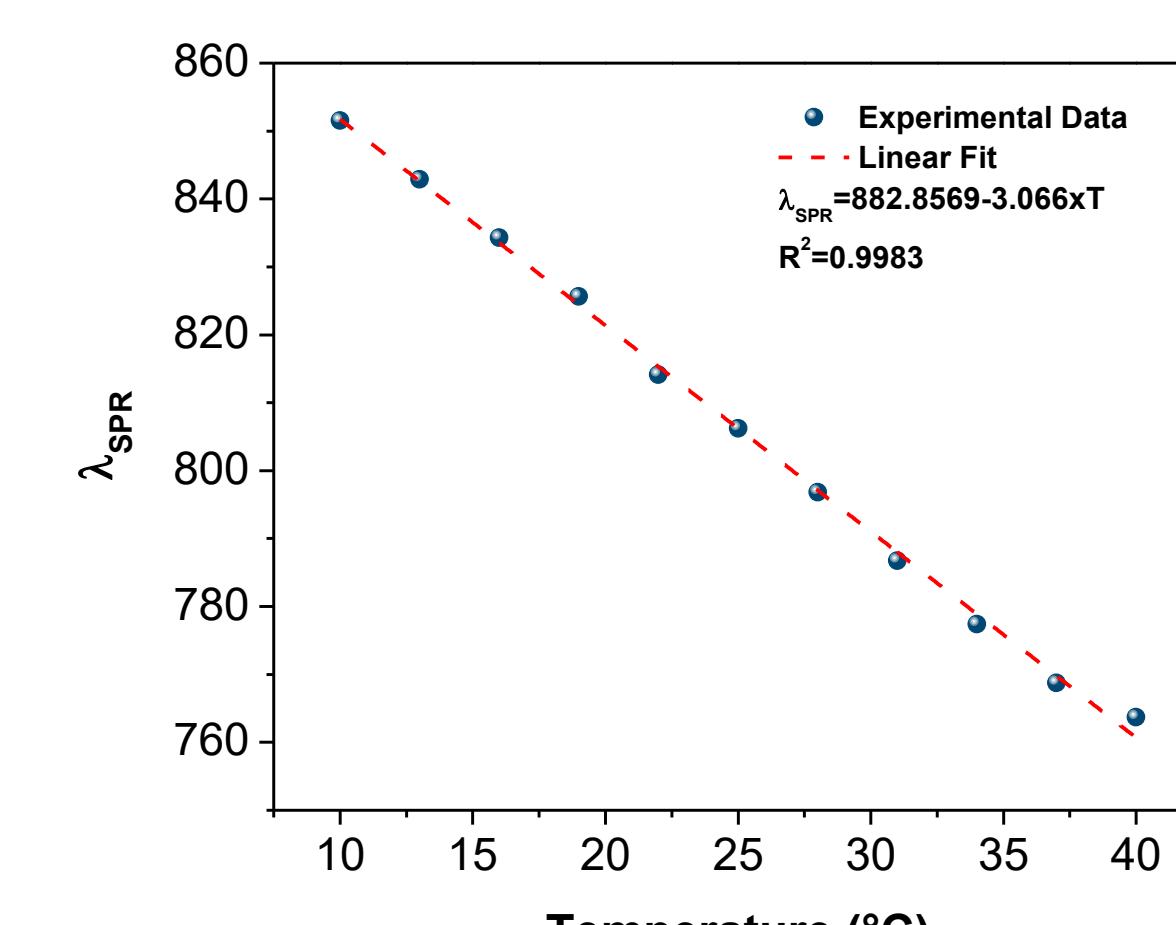

Fig. 8. Experimental calibration curve.

4.- Conclusions

We proposed and demonstrated a novel, compact and simple-to-construct optical fiber thermometer based on Surface Plasmon Resonance (SPR) phenomenon. From the experimental calibration curve, a temperature sensitivity of -3066 pm/°C was found with good linear response in the temperature range from 10°C to 40°C. We can speculate that the temperature detection resolution is around 0.5°C, assuming the resolution of the OSA is 0.1 nm and the sensitivity reached.
